The goal of the task is to design and implement a simple banking application in Spring Boot where you need to create below APIs:

1. **Open account**
   Create new account with initial balance and 10 digit unique account number

2. **Withdraw money**
   API should deduct balance from account on success, show necessary errors if fails

3. **Deposit money**
   API should add balance from account on success, show necessary errors if fails

4. **Transfer money between accounts**
   API should adjust balance for two accounts on success, show necessary errors if fails

5. **Show Balance**
   Should return account details with balance for provided account number.

6. **Account statement**
   [{"type":"deposit", "amount":5000, "date":01/01/2025},
   {"type":"withdraw", "amount":1000, "date":02/01/2025}]
